

Medical Record Manager API - Documentation

Project Overview

This API allows basic CRUD operations for managing medical patient records using FastAPI and SQLite. It includes endpoints for creating, retrieving, updating, and deleting patient data. This backend system can be used in hospital or clinic environments as part of an EHR (Electronic Health Record) system.

API Endpoints

1. POST /patients/ - Add a new patient

Body: {name, age, gender, medical_history}

2. GET /patients/ - Retrieve all patients

3. GET /patients/{id} - Get a specific patient by ID

4. PUT /patients/{id} - Update a patient's information

Body: {name, age, gender, medical_history}

5. DELETE /patients/{id} - Delete a patient by ID

Database Schema

Table: patients

- id (INTEGER, PRIMARY KEY)

- name (TEXT)

- age (INTEGER)

Medical Record Manager API - Documentation

- gender (TEXT)
- medical_history (TEXT)

Technologies Used

- Python 3.10+
- FastAPI
- SQLite
- FPDF for documentation
